

Paired, floor-guarded evaluation under image corruptions

Subtract the matched-clean INT8--FP8 gap before interpreting the corrupted-input gap

1 Match four treatment cells

same ordered images
matched JPEG-95 bytes

one checkpoint · one decoder · identical bytes

2 Estimate the interaction

subtract the matched-clean
treatment discrepancy

$$\Delta E = (AP_{FP8} - AP_{INT8})_{corrupt} \\ - (AP_{FP8} - AP_{INT8})_{J95}$$

common-image bootstrap preserves all four dependencies

FP32 supports treatment diagnostics but cancels
from the direct paired interaction

3 Guard the conclusion

check task accuracy before
interpreting gap contraction

1

matched-clean
fidelity

2

absolute corrupted
accuracy

3

interaction, then
runtime

Gap contraction near a shared accuracy floor
is not retained robustness.
